

Dear David,

I have had a quick review of the Proposed Direction on Grid Connections, and note that *there is still no mention of facilitating the connection small non-interacting projects, even though there was general agreement on that concept during the consultation process. There should be such a clause.*

We are installing an 850kW turbine on our campus in April. We are using our own internal electrical infrastructure only. We are nowhere near any other wind projects, and no grid interaction studies will be required. The connection will be almost as simple as connecting three wires. It would indeed be strange if the turbine went up and didn't operate while we wait for three wires to be connected!

Kind regards,

Larry Staudt, manager
